

Source Marts

HaDooop like data lakes

Type: Platform

ID: 3474

Revised: 2020-Mar-10

The Late-Binding™ Architecture of the DOS platform streamlines and automates the process of bringing data into the warehouse from source HCIT systems.

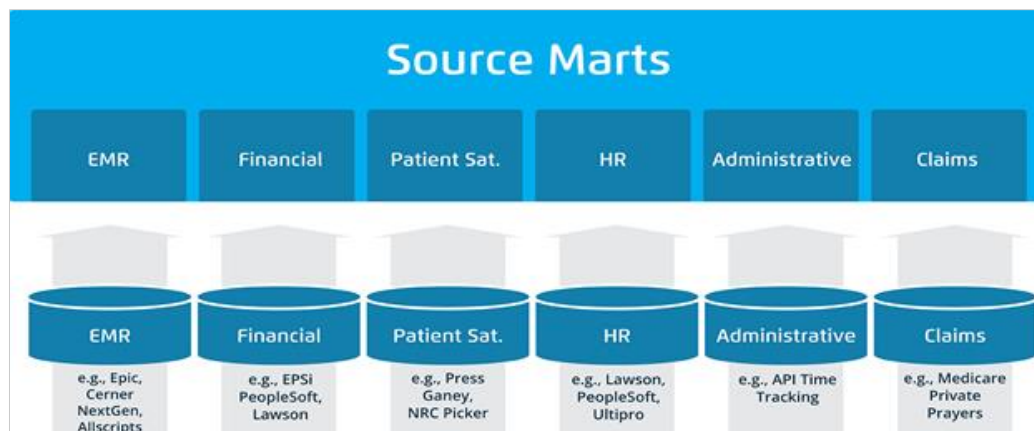

A **Source Mart** contains the data that have been extracted, minimally transformed, and loaded into DOS. Metadata, created by **Source Mart Designer** during the mapping of the Source Mart integration process, is used to drive the nightly update (extract, transform and load or ETL) process of Source Mart data. Periodically, typically each night, the Source Mart data are refreshed to include new data or updated data from the source system. The data are then available for downstream use in Software Applications, Analytics Accelerators, reports and local applications.

A list of currently available source marts can be found at the link below or in the Appendix.
